

MPLAB[®] IDE
Quick Start Guide

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip's products as critical components in life support systems is not authorized except with express written approval by Microchip. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.

Trademarks

The Microchip name and logo, the Microchip logo, Accuron, dsPIC, KEELoQ, microID, MPLAB, PIC, PICmicro, PICSTART, PRO MATE, PowerSmart, rPIC, and SmartShunt are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

AmpLab, FilterLab, Migratable Memory, MXDEV, MXLAB, PICMASTER, SEEVAL, SmartSensor and The Embedded Control Solutions Company are registered trademarks of Microchip Technology Incorporated in the U.S.A.

QUALITY MANAGEMENT SYSTEM
CERTIFIED BY DNV
== ISO/TS 16949:2002 ==

Microchip received ISO/TS-16949:2002 quality system certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona and Mountain View, California in October 2003. The Company's quality system processes and procedures are for its PICmicro® 8-bit MCUs, KEELoQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.

MPLAB® IDE Quick Start

NOTES:

Chapter 1. What is MPLAB® IDE?

1.1 AN OVERVIEW OF EMBEDDED SYSTEMS

MPLAB® IDE is a software program that runs on a Personal Computer (PC) to develop applications for Microchip microcontrollers. It is called an Integrated Development Environment, or IDE, because it provides a single integrated “environment” to develop code for embedded microcontrollers. Experienced embedded systems designers may want to skip ahead to **Section 1.7 “Components of MPLAB IDE”**. It is also recommended that **Section 1.9 “MPLAB IDE On-line Help”** and **Section 1.10 “MPLAB IDE Updates and Version Numbering”** be reviewed. The rest of this chapter briefly explains embedded systems development and how MPLAB IDE is used.

1.1.1 Description of an “Embedded System”

An embedded system is typically a design making use of the power of a small microcontroller, like the Microchip PICmicro® microcontroller (MCU) or dsPIC® Digital Signal Controller (DSC). These microcontrollers combine a microprocessor unit (like the Central Processing Unit (CPU) in a desktop PC) with some additional circuits called “peripherals”, plus some additional circuits on the same chip to make a small control module requiring few other external devices. This single device can then be embedded into other electronic and mechanical devices for low-cost digital control.

1.1.2 Differences Between an Embedded Controller and a PC

The main difference between an embedded controller and a PC is that the embedded controller is dedicated to one specific task or set of tasks. A PC is designed to run many different types of programs and to connect to many different external devices. An embedded controller has a single program and, as a result, can be made cheaply to include just enough computing power and hardware to perform that dedicated task. A PC has a relatively expensive generalized central processing unit at its heart with many other external devices (memory, disk drives, video controllers, network interface circuits, etc.). An embedded system has a low-cost microcontroller unit for its intelligence, with many peripheral circuits on the same chip, and with relatively few external devices. Often, an embedded system is an invisible part, or sub-module, of another product such as a cordless drill, refrigerator or garage door opener. The controller in these products does a tiny portion of the function of the whole device. The controller adds low-cost intelligence to some of the critical sub-systems in these devices.

An example of an embedded system is a smoke detector. Its function is to evaluate signals from a sensor and sound an alarm if the signals indicate the presence of smoke. A small program in the smoke detector either runs in an infinite loop, sampling the signal from the smoke sensor, or lies dormant in a low-power “sleep” mode, being awakened by a signal from the sensor. The program then sounds the alarm. The program would possibly have a few other functions, such as a user test function and a low battery alert. While a PC with a sensor and audio output could be programmed to do the same function, it would not be a cost-effective solution (nor would it run on a nine-volt battery, unattended for years!). Embedded designs use inexpensive microcontrollers to put intelligence into the everyday things in our environment, such as smoke detectors, cameras, cell phones, appliances, automobiles, smart cards and security systems.

1.1.3 Components of a Microcontroller

The PICmicro MCU has program memory for the firmware, or coded instructions, to run a program. It also has “file register” memory for storage of variables that the program will need for computation or temporary storage. It also has a number of peripheral device circuits on the same chip. Some peripheral devices are called I/O ports. I/O ports are pins on the microcontroller that can be driven high or low to send signals, blink lights, drive speakers – just about anything that can be sent through a wire. Often these pins are bidirectional and can also be configured as inputs allowing the program to respond to an external switch, sensor or to communicate with some external device.

FIGURE 1-1: PICmicro® MCU DATA SHEET – BLOCK DIAGRAM (EXCERPT)

In order to design such a system, it must be decided which peripherals are needed for an application. Analog-to-Digital Converters (ADCs) allow microcontrollers to connect to sensors and receive changing voltage levels. Serial communication peripherals allow you to stream communications over a few wires to another microcontroller, to a local network or to the internet. Peripherals on the PICmicro MCU called “timers” accurately measure signal events and generate and capture communications signals, produce precise waveforms and even automatically reset the microcontroller if it gets “hung” or lost due to a power glitch or hardware malfunction. Other peripherals detect if the external power is dipping below dangerous levels so the microcontroller can store critical information and safely shut down before power is completely lost.

The peripherals and the amount of memory an application needs to run a program largely determines which PICmicro MCU to use. Other factors might include the power consumed by the microcontroller and its “form factor” (i.e., the size and characteristics of the physical package that must reside on the target design).

FIGURE 1-2: PICmicro® MCU DEVICE PACKAGE

1.1.4 Implementing an Embedded System Design with MPLAB IDE

A development system for embedded controllers is a system of programs running on a desktop PC to help write, edit, debug and program code – the intelligence of embedded systems applications – into a microcontroller. MPLAB IDE runs on a PC and contains all the components needed to design and deploy embedded systems applications.

The typical tasks for developing an embedded controller application are:

1. Create the high level design. From the features and performance desired, decide which PICmicro MCU or dsPIC DSC device is best suited to the application, then design the associated hardware circuitry. After determining which peripherals and pins control the hardware, write the firmware – the software that will control the hardware aspects of the embedded application. A language tool such as an assembler, which is directly translatable into machine code, or a compiler that allows a more natural language for creating programs should be used to write and edit code. Assemblers and compilers help make the code understandable, allowing function labels to identify code routines with variables that have names associated with their use, and with constructs that help organize the code in a maintainable structure.

FIGURE 1-3: PICmicro® MCU DATA SHEET – TIMING (EXCERPT)

FIGURE 1-4: PICmicro® MCU DATA SHEET – INSTRUCTIONS (EXCERPT)

RRNCF	Rotate Right f (no carry)								
Syntax:	[label] RRNCF f[,d[,a]]								
Operands:	0 ≤ f ≤ 255 d ∈ {0,1} a ∈ {0,1}								
Operation:	(regs) ← dest ← 1's (<0>) ← dest<f>								
Status Affected:	N, Z								
Encoding:	0100 000a ffff ffff								
Description:	The contents of register f are rotated one bit to the right. If 'd' is '1', the result is placed in W. If 'd' is '0', the result is placed back in register f (default). If 'a' is '0', the Access Bank will be selected, overriding the BSR value; if 'a' is '1', then the bank will be selected as per the BSR value (default). 								
Words:	1								
Cycles:	1								
Q Cycle Activity:	<table border="1"> <thead> <tr> <th>Q1</th> <th>Q2</th> <th>Q3</th> <th>Q4</th> </tr> </thead> <tbody> <tr> <td>Decode</td> <td>Read register f</td> <td>Process Data</td> <td>Write to destination</td> </tr> </tbody> </table>	Q1	Q2	Q3	Q4	Decode	Read register f	Process Data	Write to destination
Q1	Q2	Q3	Q4						
Decode	Read register f	Process Data	Write to destination						
Example 1:	RRNCF REG, 1, 0 Before Instruction REG = 1101 0111 After Instruction REG = 1110 1011								
Example 2:	RRNCF REG, 0, 0 Before Instruction W = ? REG = 1101 0111 After Instruction W = 1110 1011 REG = 1101 0111								

2. Compile, assemble and link the software using the assembler and/or compiler and linker to convert your code into “ones and zeroes” – machine code for the PICmicro MCUs. This machine code will eventually become the firmware (the code programmed into the microcontroller).
3. Test your code. Usually a complex program does not work exactly the way imagined, and “bugs” need to be removed from the design to get proper results. The debugger allows you to see the “ones and zeroes” execute, related to the source code you wrote, with the symbols and function names from your program. Debugging allows you to experiment with your code to see the value of variables at various points in the program, and to do “what if” checks, changing variable values and stepping through routines.
4. “Burn” the code into a microcontroller and verify that it executes correctly in the finished application.

Of course, each of these steps can be quite complex. The important thing is to concentrate on the details of your own design, while relying upon MPLAB IDE and its components to get through each step without continuously encountering new learning curves.

Step 1 is driven by the designer, although MPLAB IDE can help in modeling circuits and code so that crucial design decisions can be made.

MPLAB IDE really helps with steps 2 through 4. Its programmer's Editor helps write correct code with the language tools of choice. The Editor is aware of the assembler and compiler programming constructs and automatically "color-keys" the source code to help ensure it is syntactically correct. The Project Manager enables you to organize the various files used in your application: source files, processor description header files and library files. When the code is built, you can control how rigorously code will be optimized for size or speed by the compiler and where individual variables and program data will be programmed into the device. You can also specify a "memory model" in order to make the best use of the microcontroller's memory for your application. If the language tools run into errors when building the application, the offending line is shown and can be "double clicked" to go to the corresponding source file for immediate editing. After editing, press the "build" button to try again. Often this write-compile-fix loop is done many times for complex code, as the sub-sections are written and tested. MPLAB IDE goes through this loop with maximum speed, allowing you to go on to the next step.

Once the code builds with no errors, it needs to be tested. MPLAB IDE has components called "debuggers" and free software simulators for all PICmicro MCUs and dsPIC DSC devices to help test the code. Even if the hardware is not yet finished, you can begin testing the code with the simulator, a software program that simulates the execution of the microcontroller. The simulator can accept a simulated input (stimulus), in order to model how the firmware responds to external signals. The simulator can measure code execution time, single step through code to watch variables and peripherals and trace the code to generate a detailed record of how the program ran.

Once the hardware is in a prototype stage, a hardware debugger, such as MPLAB ICE or MPLAB ICD 2, can be used. These debuggers run the code in real time on your actual application. The MPLAB ICE physically replaces the microcontroller in the target using a high-speed probe to give you full control over the hardware in your design. The MPLAB ICD 2 uses special circuitry built into many Microchip MCUs with Flash program memory and can "see into" the target microcontrollers program and data memory. The MPLAB ICD 2 can stop and start program execution, allowing you to test the code with the microcontroller in place on the application.

After the application is running correctly, you can program a microcontroller with one of Microchip's device programmers, such as PICSTART® Plus, MPLAB ICD 2 or MPLAB PM3. These programmers verify that the finished code will run as designed. MPLAB IDE supports most PICmicro MCUs and every dsPIC digital signal controller.

1.2 THE DEVELOPMENT CYCLE

The process for writing an application is often described as a development cycle, as it is rare that all the steps from design to implementation can be done flawlessly the first time. More often code is written, tested and then modified in order to produce an application that performs correctly. The integrated development environment allows the embedded systems design engineer to progress through this cycle without the distraction of switching among an array of tools. By using MPLAB IDE, all the functions are integrated, allowing the engineer to concentrate on completing the application without the interruption of separate tools and different modes of operation.

FIGURE 1-5: THE DESIGN CYCLE

The IDE is a “wrapper” that coordinates all the tools from a single graphical user interface – usually automatically. For instance, once code is written, it can be converted to executable instructions and downloaded into a microcontroller to see how it works. In this process multiple tools are needed: an Editor to write the code, a Project Manager to organize files and settings, a compiler or assembler to convert the source code to machine code and some sort of hardware or software that either connects to a target microcontroller or simulates the operation of a microcontroller.

1.3 PROJECT MANAGER

The Project Manager organizes the files to be edited and other associated files so they can be sent to the language tools for assembly or compilation, and ultimately to a linker. The linker has the task of placing the object code fragments from the assembler, compiler and libraries into the proper memory areas of the embedded controller, and ensuring that the modules function with each other (or are “linked”). This entire operation, from assembly and compilation through the link process is called a project “build”. From the MPLAB Project Manager, properties of the language tools can be invoked differently for each file, if desired, and a build process integrates all of the language tool operations.

FIGURE 1-6: MPLAB® PROJECT MANAGER

The source files are text files that are written conforming to the rules of the assembler or compiler. The assembler and compiler convert them into intermediate modules of machine code and placeholders for references to functions and data storage. The linker resolves these placeholders and combines all the modules into a file of executable machine code. The linker also produces a debug file which allows MPLAB IDE to relate the executing machine codes back to the source files.

A text Editor is used to write the code. It is not a normal text editor, but an editor specifically designed for writing code for Microchip MCUs. It recognizes the constructs in the text and uses color coding to identify various elements, such as instruction mnemonics, C language constructs and comments. The Editor supports operations commonly used in writing source code, such as finding matching braces in C, commenting and un-commenting out blocks of code, finding text in multiple files and adding special bookmarks. After the code is written, the Editor works with the other tools to display code execution in the debugger. Breakpoints can be set in the Editor, and the values of variables can be inspected by hovering the mouse pointer over the variable name. Names of variables can be dragged from source text windows and then dropped into a Watch window.

1.4 LANGUAGE TOOLS

Language tools are programs such as cross-assemblers and cross-compilers. Most people are familiar with language tools that run on a PC such as Visual Basic or C compilers. When using language tools for embedded systems, a “cross-assembler” or “cross-compiler” is used. These tools differ from typical compilers in that they run on a PC but produce code to run on another microprocessor, hence they “cross-compile” code for a microcontroller that uses an entirely different set of instructions from the PC. The language tools also produce a debug file that MPLAB IDE uses to correlate the machine instructions and memory locations with the source code. This bit of integration allows the MPLAB Editor to set breakpoints, allows Watch windows to view variable contents, and lets you single step through the source code, watching the application execute.

Embedded system language tools also differ somewhat for compilers that run and execute on a PC in that they must be very space conscious. The smaller the code produced, the better, because that allows the smallest possible memory for the target, thereby reducing cost. This means that techniques to optimize and enhance the code using machine-specific knowledge are desirable. The size of programs for PCs typically extends into the megabytes for moderately complex programs. The size of simple embedded systems programs may be as small as a thousand bytes or less. A medium size embedded system might need 32K or 64K of code for relatively complex functions. Some embedded systems use megabytes of storage for large tables, user text messages or data logging.

FIGURE 1-7: A COMPILER CONVERTS SOURCE CODE INTO MACHINE INSTRUCTIONS

1.5 TARGET DEBUGGING

In a development environment, the execution of the code is tested on a debugger. The debugger can be a software program that simulates the operation of the microcontroller for testing or it can be special instrumentation to analyze the program as it executes in the application.

Simulators are built into MPLAB IDE so a program can be tested without any additional hardware. A simulator is a software debugger, and the debugger functions for the simulator are almost identical to the hardware debuggers, allowing a new tool to be learned with ease. Usually a simulator runs somewhat slower than an actual microcontroller, since the CPU in the PC is being used to simulate the operations of the microcontroller. In the case of MPLAB IDE, there are many simulators for each of the PICmicro MCUs and the dsPIC DSC processors.

There are two types of hardware that can be used with MPLAB IDE: programmers and hardware debuggers. A programmer simply transfers the machine code from the PC into the internal memory of the target microcontroller. The microcontroller can then be plugged into the application and, hopefully, it will run as designed.

Usually, however, the code does not function exactly as anticipated, and the engineer is tasked with reviewing the code and its operation in the application to determine how to modify the original source code to make it execute as desired. This process is called debugging. As noted previously, the simulator can be used to test how the code will operate, but once a microcontroller is programmed with the firmware, many things outside the scope of the simulator come into play. Using just a programmer, the code could be changed, reprogrammed into the microcontroller and plugged into the target for retest, but this could be a long, laborious cycle if the code is complex, and it is difficult to understand exactly what is going wrong in the hardware.

This is where a hardware debugger is useful. Hardware debuggers can be in-circuit emulators, which use specialized hardware in place of the actual target microcontroller, or they can be in-circuit debuggers, which use microcontrollers that have special built-in debugging features. A hardware debugger, like a simulator, allows the engineer to inspect variables at various points in the code and single step to follow instructions as the hardware interacts with its specialized circuitry.

Debugging usually becomes urgent near the end of the projected design cycle. As deadlines loom, getting the application to function as originally designed is the last step before going into deployment of the product, and often has the most influence on producing delays in getting a product out. That's where an integrated development environment is most important. Doing fine "tweaks" to the code, recompiling, downloading and testing all require time. Using all tools within a single environment will reduce the time around the "cycle". These last steps, where critical bugs are worked out, are a test for the embedded systems designer. The right tool can save time. With MPLAB IDE, many tools can be selected, but they all will have a similar interface, and the learning curve from simulator to low-cost in-circuit debugger to powerful in-circuit emulator is small.

1.6 DEVICE PROGRAMMING

After the application has been debugged and is running in the development environment, it needs to be tested on its own. A device can be programmed with the in-circuit debugger or a device programmer. MPLAB IDE can be set to the programmer function, and the part can be "burned". The target application can now be observed in its nearly final state. Engineering prototype programmers allow quick prototypes to be made and evaluated. Some applications can be programmed after the device is soldered on the target PC board. Using In-Circuit Serial Programming™ (ICSP™), the firmware can be programmed into the application at the time of manufacture, allowing updated revisions to be programmed into an embedded application later in its life cycle. Devices that support in-circuit debugging can even be plugged back into the MPLAB ICD 2 after manufacturing for quality tests and development of next generation firmware.

1.7 COMPONENTS OF MPLAB IDE

The MPLAB IDE has both built-in components and plug-in modules to configure the system for a variety of software and hardware tools.

1.7.1 MPLAB IDE Built-In Components

The built-in components consist of:

- **Project Manager**

The Project Manager provides integration and communication between the MPLAB IDE and the language tools.

- **Editor**

The Editor is a full-featured programmer's text editor that also serves as a window into the debugger.

- **Assembler/Linker and Language Tools**

The assembler can be used standalone to assemble a single file, or can be used with the linker to build a project from separate source files, libraries and recompiled objects. The linker is responsible for positioning the compiled code into memory areas of the target microcontroller.

- **Debugger**

The Microchip debugger allows breakpoints, single stepping, Watch windows and all the features of a modern debugger for the MPLAB IDE. It works in conjunction with the Editor to reference information from the target being debugged back to the source code.

- **Execution Engines**

There are software simulators in MPLAB IDE for all PICmicro MCUs and dsPIC DSC devices. These simulators use the PC to simulate the instructions and some peripheral functions of the PICmicro MCU and dsPIC DSC device. Optional in-circuit emulators and in-circuit debuggers are also available to test code as it runs in the applications hardware.

1.7.2 Additional Optional Components for MPLAB IDE

Optional components can be purchased and added to the MPLAB IDE:

- **Compiler Language Tools**

MPLAB C18 and MPLAB C30 C compilers from Microchip provide fully integrated, optimized code. Along with other language tools from HI-TECH, IAR, microEngineering Labs, CCS and Byte Craft, they are invoked by the MPLAB IDE Project Manager to compile code that is automatically loaded into the target debugger for instant testing and verification.

- **Programmers**

PICSTART Plus, PRO MATE® II, MPLAB PM3 and MPLAB ICD 2 can program code into target microcontrollers. MPLAB IDE offers full control over programming both code and data, as well as the configuration bits to set the various operating modes of the target microcontrollers.

- **In-Circuit Emulators**

MPLAB ICE 2000 and MPLAB ICE 4000 are full-featured emulators for PICmicro MCUs and dsPIC DSC devices. They connect to the PC via I/O ports and allow full control over the operation of microcontrollers in the target applications.

- **In-Circuit Debugger**

MPLAB ICD 2 provides an economic alternative to an emulator. By using some of the on-chip resources, MPLAB ICD 2 can download code into a target microcontroller inserted in the application, set breakpoints, single step and monitor registers and variables.

1.8 MPLAB IDE DOCUMENTATION

The following documents are available to help you use MPLAB IDE:

- *Application Development with MPLAB® IDE* (DS51410)
- *MPLAB® IDE Quick Start Guide* (DS51281)
- *MPLAB® IDE User's Guide* (DS51519)

Other documents exist for various Microchip software and hardware tools that work with MPLAB IDE. Check the Microchip web site (www.microchip.com) for downloadable PDF versions of all these documents.

1.9 MPLAB IDE ON-LINE HELP

Since MPLAB IDE is under a constant state of change (see **Section 1.10 “MPLAB IDE Updates and Version Numbering”**), some details in this documentation may change. Dialogs might not appear exactly as they do in this manual, menu lists may be in a different order or may have new items. For this reason, the on-line help is the best reference to the version of MPLAB IDE being used.

MPLAB IDE comes with extensive on-line help, which is constantly being updated. If questions arise while using MPLAB IDE, be sure to check the on-line help for answers. Most importantly, the on-line help lists any restrictions that might exist for a particular tool in support of a particular device. Always try to review this section before working with a new device/tool combination.

The **Limitations** tab in the *Debugger>Settings* dialog displays any restrictions the simulator, emulator or in-circuit debugger might have, compared to the actual device being simulated. General limitations are shown in the text area.

FIGURE 1-8: *DEBUGGER>SETTINGS*: LIMITATIONS TAB

Press the **Details** button to show specific limitations of the device being debugged. From this display, help on general limitations related to the debugger can also be accessed.

FIGURE 1-9: SIMULATOR LIMITATIONS DETAIL

What is MPLAB® IDE?

From the main MPLAB IDE Help menu, select [Help>Topics](#) to get a list of help on MPLAB IDE and all of its components.

FIGURE 1-10: MPLAB® IDE [HELP>TOPICS](#) MENU

MPLAB IDE Help covers all aspects of MPLAB IDE and most of the Microchip tools. It can be viewed in an outline or as an index and has a search utility for help on any MPLAB IDE topic. It also directs users to other types of assistance, such as the Customer Change Notification system.

FIGURE 1-11: MPLAB® IDE HELP DIALOG

1.10 MPLAB IDE UPDATES AND VERSION NUMBERING

MPLAB IDE is an evolving program with thousands of users. Microchip is continually designing new microcontrollers with new features. Many new MPLAB IDE features come from customer requests and from internal usage. Continued new designs and the release of new microcontrollers ensure that MPLAB IDE will continue to evolve.

MPLAB IDE is scheduled for a version update approximately every four months to add new device support and new features. Additional "interim" releases are produced in between these major releases. The version numbering scheme for MPLAB IDE reflects whether it is a major production release or an interim release. If the version number ends in a zero, e.g., MPLAB IDE v7.00, v7.10 or v7.20, this identifies a major production release. If the version number ends with a digit other than zero, e.g., v7.11, v7.22 or v7.55, this identifies an interim release. Interim releases are typically provided for early adopters of new devices or components, for quick critical fixes or for previews of new features. These interim releases, although based on production releases that are fully tested, may have components that are not as fully tested, and therefore these releases are not recommended for rigorous design use. It is advised that production releases be used for development work, unless a new device or component is being used or a particular problem has been fixed in an interim release that enables more productive use of MPLAB IDE.

Each new release of the MPLAB IDE software has new features implemented, so the printed documentation inevitably will "lag" the on-line help. The on-line help is the best source for any questions about MPLAB IDE.

To be notified of updates to MPLAB IDE and its components, subscribe to the Development Tools section of the Customer Change Notification service on www.microchip.com.

Chapter 2. A Basic Tutorial for MPLAB IDE

2.1 INTRODUCTION

MPLAB Integrated Development Environment (IDE) is a comprehensive Editor, Project Manager and design desktop for application development of embedded designs using Microchip PICmicro MCUs and dsPIC DSCs.

The initial use of MPLAB IDE is covered here. How to make projects, edit code and test an application will be the subject of a short tutorial. By going through the tutorial, the basic concepts of the Project Manager, Editor and debugger can be quickly learned. The complete feature set of MPLAB IDE is covered in the *MPLAB® IDE User's Guide* (DS51519).

This section details the installation and uninstall of MPLAB IDE. It is followed by a simple step-by-step tutorial that creates a project and explains the elementary debug capabilities of MPLAB IDE. Someone unfamiliar with MPLAB IDE will get a basic understanding of using the system to develop an application. No previous knowledge is assumed, and comprehensive technical details of MPLAB IDE and its components are omitted in order to present the basic framework for using MPLAB IDE.

These basic steps will be covered in the tutorial:

- MPLAB IDE Features and Installation
- Tutorial Overview
- Selecting the Device
- Creating the Project
- Setting Up Language Tools
- Naming the Project
- Adding Files to the Project
- Building the Project
- Creating Code
- Building the Project Again
- Testing Code with the Simulator
- Tutorial Summary

2.2 MPLAB IDE FEATURES AND INSTALLATION

MPLAB IDE is a Windows® OS based integrated development environment for the PICmicro MCU families and the dsPIC digital signal controllers. The MPLAB IDE provides the ability to:

- Create and edit source code using the built-in Editor.
- Assemble, compile and link source code.
- Debug the executable logic by watching program flow with the built-in simulator or in real time with in-circuit emulators or in-circuit debuggers.
- Make timing measurements with the simulator or emulator.
- View variables in Watch windows.
- Program firmware into devices with device programmers (for details, consult the user's guide for the specific device programmer).

Note: Selected third party tools are also supported by MPLAB IDE. Check the release notes or readme files for details.

2.2.1 Install/Uninstall MPLAB IDE

To install MPLAB IDE on your system:

Note: For some Windows OS's, administrative access is required in order to install software on a PC.

- If installing from a CD-ROM, place the disk into a CD drive. Follow the on-screen menu to install MPLAB IDE. If no on-screen menu appears, use Windows Explorer to find and execute the CD-ROM menu, `menu.exe`.
- If downloading MPLAB IDE from the Microchip web site (www.microchip.com), locate the download (.zip) file, select the file and save it to the PC. Unzip the file and execute the resulting file to install.

To uninstall MPLAB IDE:

- Select *Start>Settings>Control Panel* to open the Control Panel.
- Double click on **Add/Remove Programs**. Find MPLAB IDE on the list and click on it.
- Click **Change/Remove** to remove the program from your system.

2.2.2 Running MPLAB IDE

To start MPLAB IDE, double click on the icon installed on the desktop after installation or select *Start>Programs>Microchip>MPLAB IDE vx.xx>MPLAB IDE*. A screen will display the MPLAB IDE logo followed by the MPLAB IDE desktop (Figure 2-1).

FIGURE 2-1: MPLAB® IDE DESKTOP

2.3 TUTORIAL OVERVIEW

In order to create code that is executable by the target PICmicro MCU, source files need to be put into a project. The code can then be built into executable code using selected language tools (assemblers, compilers, linkers, etc.). In MPLAB IDE, the Project Manager controls this process.

All projects will have these basic steps:

- **Select Device**
The capabilities of MPLAB IDE vary according to which device is selected. Device selection should be completed before starting a project.
- **Create Project**
MPLAB Project Wizard will be used to create a project.
- **Select Language Tools**
In the Project Wizard, the language tools will be selected. For this tutorial, the built-in assembler and linker will be used. For other projects, one of the Microchip compilers or other third party tools might be selected.
- **Put Files in Project**
Two files will be put into the project: a template file and a linker script. Both of these exist in sub-folders within the MPLAB IDE folder. Using these two files makes it easy to get started.
- **Create Code**
Some code will be added to the template file to send an incrementing value out an I/O port.
- **Build Project**
The project will be built, causing the source files to be assembled and linked into machine code that can run on the selected PICmicro MCU.
- **Test Code with Simulator**
Finally, the code will be tested with the simulator.

The Project Wizard will easily guide us through most of these steps.

Note: Some aspects of the user interface will change in future product releases and the screen shots in this tutorial may not exactly match the appearance of the MPLAB IDE desktop in later releases. New features will be added as additional parts are released. None of the functions described in this tutorial will be removed, but more features may be added. The on-line help is the most up-to-date reference for the current version of MPLAB IDE.

2.4 SELECTING THE DEVICE

To show menu selections in this document, the menu item from the top row in MPLAB IDE will be shown after the menu name like this: *MenuName>MenuItem*. To choose the *Select Device* entry in the *Configure* menu, it would be written as *Configure>Select Device*.

Choose *Configure>Select Device*. Click **OK**. In the Device dialog, select "PIC18F452" from the list if it's not already selected.

FIGURE 2-2: SELECT DEVICE DIALOG

The "lights" indicate which MPLAB IDE components support this device.

- A green light indicates full support.
- A yellow light indicates preliminary support for an upcoming part by the particular MPLAB IDE tool component. Components with a yellow light instead of a green light are often intended for early adopters of new parts who need quick support and understand that some operations or functions may not be available.
- A red light indicates no support for this device. Support may be forthcoming or inappropriate for the tool, e.g., dsPIC DSC devices cannot be supported on MPLAB ICE 2000.

2.5 CREATING THE PROJECT

The next step is to create a project using the Project Wizard. A project is the way the files are organized to be compiled and assembled. We will use a single assembly file for this project and a linker script. Choose *Project>Project Wizard*.

From the Welcome dialog, click on **Next>** to advance.

The next dialog (Step One) allows you to select the device, which we've already done. Make sure that it says PIC18F452. If it does not, select "PIC18F452" from the drop-down menu. Click **Next>**.

FIGURE 2-3: PROJECT WIZARD – SELECT DEVICE

2.6 SETTING UP LANGUAGE TOOLS

Step Two of the Project Wizard sets up the language tools that are used with this project. Select “Microchip MPASM Toolsuite” in the Active Toolsuite list box. Then “MPASM Assembler” and “MPLINK Object Linker” should be visible in the Toolsuite Contents box. Click on each one to see its location. If MPLAB IDE was installed into the default directory, the MPASM™ assembler executable will be:

```
C:\Program Files\Microchip\MPASM Suite\mpasmwin.exe
```

the MPLINK™ linker executable will be:

```
C:\Program Files\Microchip\MPASM Suite\mplink.exe
```

and the MPLIB™ librarian executable will be:

```
C:\Program Files\Microchip\MPASM Suite\mplib.exe
```

If these do not show up correctly, use the browse button to set them to the proper files in the MPLAB IDE subfolders.

FIGURE 2-4: PROJECT WIZARD – SELECT LANGUAGE TOOLS

When you are finished, click **Next>**.

2.7 NAMING THE PROJECT

Step Three of the Project Wizard allows you to name the project and put it into a folder. This sample project will be called `MyProject`. Using the Browse button, place the project in a folder named `Projects32`. Click **Next>**.

FIGURE 2-5: PROJECT WIZARD – NAME PROJECT

If the folder does not exist, a screen will appear asking if you want to create the folder (directory).

2.8 ADDING FILES TO THE PROJECT

Step Four of the Project Wizard allows file selection for the project. A source file has not yet been selected, so we will use an MPLAB IDE template file. The template files are simple files that can be used to start a project. They have the essential sections for any source file and contain information that will help you write and organize your code. There is one template file for each Microchip PICmicro MCU and dsPIC DSC device.

Choose the file named `f452tmpo.asm`. If MPLAB IDE is installed in the default location, the full path to the file will be:

```
C:\Program Files\Microchip\MPASM Suite\Template\Object\f452tmpo.asm
```

FIGURE 2-6: PROJECT WIZARD – SELECT TEMPLATE FILE

Press **Add>>** to move the file name to the right panel, and click on the check box at the start of the line with the file name to enable this file to be copied to our project directory.

Next, add the second file for our project, the linker script. There is a linker script for each device. These files define the memory configuration and register names for the various parts. Use the file named `18F452.lkr`. The full path is:

```
C:\Program Files\Microchip\MPASM Suite\LKR\18F452.lkr
```

Note: There is also a linker script named `18F452i.lkr` for use with this device when MPLAB ICD 2 is being used (hence the “i” in the name). That linker script reserves areas in memory for MPLAB ICD 2. Since the simulator is being used, we don’t need to use that linker script.

To copy this linker script into our project, click on the check box.

FIGURE 2-7: PROJECT WIZARD – SELECT LINKER SCRIPT

Make sure that your dialog looks like the picture above, with both check boxes checked, then press **Next>** to finish the Project Wizard.

The final screen of the Project Wizard is a summary showing the selected device, the toolsuite and the new project file name.

FIGURE 2-8: PROJECT WIZARD – SUMMARY

A Basic Tutorial for MPLAB IDE

After pressing the **Finish** button, review the Project window on the MPLAB IDE desktop. It should look like Figure 2-9. If the Project window is not open, select View>Project.

FIGURE 2-9: PROJECT WINDOW

TIP: Files can be added and projects saved by using the right mouse button in the Project window. In case of error, files can be manually deleted by selecting them and using the right mouse click menu.

2.9 BUILDING THE PROJECT

From the Project menu, we can assemble and link the current files. They don't have any of our code in them yet, but this assures that the project is set up correctly.

To build the project, select either:

- *Project>Build All*
- Right click on the project name in the Project window and select "Build All".
- Click the **Build All** icon on the Project toolbar. Hover the mouse over icons to see pop-up text of what they represent.

The Output window shows the result of the build process. There should be no errors on any step.

The warnings listed in **Figure 2-10: "Output Window"** will not interfere with the operation of the tutorial program. They are merely identifying a directive that has been deprecated (i.e., is being discontinued in favor of another). To turn off the display of warnings, do the following:

- Select *Project>Build Options>Project* and click on the **MPASM Assembler** tab.
- Select "Output" from the "Categories" drop-down list.
- Select "Errors only" from the "Diagnostic level" drop-down list.
- Click **OK**.

FIGURE 2-10: OUTPUT WINDOW

2.10 CREATING CODE

Open the template file in the project by double clicking on its name in the Project window, or by selecting it with the cursor and using the right mouse button to bring up the Context menu:

FIGURE 2-11: PROJECT CONTEXT MENU (RIGHT MOUSE CLICK)

The file has some comments at the beginning, and this area can be used as a standard comment information header for the file. For now you'll leave this as it is, but if this were a real project, you could put information about your design here.

Note: Line numbers are shown here. Line numbers may be toggled on/off by right clicking in the Editor window, selecting "Properties", and then checking/unchecking "Line Numbers" on the **Editor** tab of the Editor Options dialog.

FIGURE 2-12: TEMPLATE FILE

The code in the first part of the file is for more advanced functions such as setting up interrupts and configuration bits in a final application. These details can be ignored at this point with focus on writing the code. The new code will be placed in the file at the point after the symbol `Main` is defined.

Scroll down to the bottom of the file.

FIGURE 2-13: TEMPLATE FILE – MAIN

When any source file is opened, you are automatically in the Editor. Type in this code:

Main:

```
    clrf    WREG
    movwf  PORTC    ; clear PORTC
    movwf  TRISC    ; configure PORTC as all outputs

Init
    clrf    COUNT
IncCount
    incf    COUNT
    movf    COUNT,W
    movwf  PORTC    ; display COUNT on PORTC

    call   Delay
    goto   IncCount ; infinite loop

Delay
    movlw  0x40    ; set outer delay loop
    movwf  DVAR2
Delay0
    movlw  0xFF
    movwf  DVAR    ; set inner delay loop
Delay1
    decfsz DVAR
    goto   Delay1

    decfsz DVAR2
    goto   Delay0
    return
```

A Basic Tutorial for MPLAB IDE

In this bit of code, we used three variables named COUNT, DVAR and DVAR2. These variables need to be defined in the template file in the UDATA section for uninitialized data. There are already three variables in this section of the template file, and ours can be added at the end using the same format. Each variable is 8-bit, so only 1 byte each needs to be reserved.

FIGURE 2-14: TEMPLATE FILE – ADD VARIABLES

```
58 ;*****
59 ;Variable definitions
60 ; These variables are only needed if low priority interrupts are used.
61 ; More variables may be needed to store other special function registers used
62 ; in the interrupt routines.
63
64     UDATA
65
66     WREG_TEMP RES 1 ;variable in RAM for context saving
67     STATUS_TEMP RES 1 ;variable in RAM for context saving
68     BSR_TEMP RES 1 ;variable in RAM for context saving
69
70     COUNT RES 1
71     DVAR RES 1
72     DVAR2 RES 1
73
74     UDATA_ACS
75
76     EXAMPLE RES 1 ;example of a variable in access RAM
77
78 ;*****
```

Add

three
lines

2.11 BUILDING THE PROJECT AGAIN

Select *Project>Build All* to assemble and link the code. If the code assembled with no errors, the Output window will look like Figure 2-15.

FIGURE 2-15: BUILD OUTPUT WINDOW

If the code did not assemble and link successfully, check the following items and then build the project again:

- Check the spelling and format of the code entered in the Editor window. Make sure the new variables and the special function registers, TRISC and PORTC, are in upper case. If the assembler reported errors in the Output window, double click on the error and MPLAB IDE will open the corresponding line in the source code with a green arrow in the left margin of the Source Code window.
- Check that the correct assembler (MPASM assembler) and linker for PICmicro MCUs is being used. Select *Project>Set Language Tool Locations*. Click on the plus boxes to expand the Microchip MPASM toolsuite and its executables. Click **MPASM Assembler** (mpasmwin.exe) and review their location in the display. If the location is correct, click **Cancel**. If it is not, change it and then click **OK**. The default search paths can be empty.

Upon a successful build, the output file generated by the language tool will be loaded. This file contains the object code that can be programmed into a PICmicro MCU and debugging information so that source code can be debugged and source variables can be viewed symbolically in Watch windows.

Note: The real power of projects is evident when there are many files to be compiled/assembled and linked to form the final executable application, as in a real application. Projects keep track of all of this. Build options can be set for each file that access other features of the language tools, such as report outputs and compiler optimizations.

2.12 TESTING CODE WITH THE SIMULATOR

In order to test the code, software or hardware is needed that will execute the PICmicro MCU instructions. A debug execution tool is a hardware or software tool that is used to inspect code as it executes a program (in this case `cnt452.asm`). Hardware tools such as MPLAB ICE or MPLAB ICD 2 can execute code in real devices. If hardware is not available, the MPLAB simulator can be used to test the code. For this tutorial use the MPLAB SIM simulator.

The simulator is a software program that runs on the PC to *simulate* the instructions of the PICmicro MCU. It does not run in “real time”, since the *simulator* program is dependent upon the speed of the PC, the complexity of the code, overhead from the operating system and how many other tasks are running. However, the simulator accurately *measures* the time it would take to execute the code if it were operating in real time in an application.

Note: Other debug execution tools include MPLAB ICE 2000, MPLAB ICE 4000 and MPLAB ICD 2. These are optional hardware tools to test code on the application PC board. Most of the MPLAB IDE debugging operations are the same as the simulator, but unlike the simulator, these tools allow the target PICmicro MCU to run at full speed in the actual target application.

Select the simulator as the debug execution tool. This is done from the *Debugger>Select Tool* pull down menu. After selecting “MPLAB SIM”, the following changes should be seen (see corresponding numbers in Figure 2-16):

- 1 The status bar on the bottom of the MPLAB IDE window should change to “MPLAB SIM”.
- 2 Additional menu items should now appear in the Debugger menu.
- 3 Additional toolbar icons should appear in the Debug Tool Bar.

TIP: Position the mouse cursor over a toolbar button to see a brief description of the button’s function.

- 4 An MPLAB SIM tab is added to the Output window.

FIGURE 2-16: MPLAB® IDE DESKTOP WITH MPLAB SIM AS DEBUGGER

Next, select *Debugger>Reset>Processor Reset* and a green arrow shows where the program will begin. This was part of the template file. The first instruction in memory jumps to the label called *Main*, where your code was inserted. This instruction jumps over the PIC18XXX vector areas in lower memory.

FIGURE 2-17: CODE AFTER PROCESSOR RESET

```

82 DATA_EEPROM CODE 0xf00000
83
84 DE "Test Data",0,1,2,3,4,5
85
86 ;*****
87 ;Reset vector
88 ; This code will start executing when a reset occurs.
89
90 RESET_VECTOR CODE 0x0000
91
92 | goto Main ;go to start of main code
93
94 ;*****
95 ;High priority interrupt vector
96 ; This code will start executing when a high priority interrupt o
97 ; when any interrupt occurs if interrupt priorities are not enabl
98
99 HI_INT_VECTOR CODE 0x0008
100
101 bra HighInt ;go to high priority interrupt routine
  
```

To single step through the application program, you would select *Debugger>Step Into*. This will execute the currently indicated line of code and move the arrow to the next line of code to be executed.

There are shortcuts for these commonly used functions in the Debug Tool Bar.

TABLE 2-1: DEBUG SHORTCUT ICONS

Debugger Menu	Toolbar Buttons	Hot Key
Run		F9
Halt		F5
Animate		
Step Into		F7
Step Over		F8
Step Out		
Reset		F6

TIP: Click on the appropriate icon on the toolbar or use the hot key shown next to the menu item. This is usually the best method for repeated stepping.

A Basic Tutorial for MPLAB IDE

Next, press the Step Into icon or select *Debugger>Step Into* to single step to the code at Main.

FIGURE 2-18: CODE AFTER STEP INTO

In order to see if the code is operating as intended and sending incrementing values out PORTC, watch the values being sent to PORTC. Select *View>Watch* to bring up an empty Watch window. There are two pull downs at the top of the Watch window. The one on the left labeled "Add SFR" can be used to add the Special Function Register, PORTC, into the watch. Select "PORTC" from the list and then click **Add SFR** to add it to the window.

FIGURE 2-19: WATCH – SELECT PORTC

The pull down on the right allows symbols to be added from the program. Use this pull down to add the `COUNT` variable into the Watch window. Select “`COUNT`” from the list and then click **Add Symbol** to add it to the window.

FIGURE 2-20: WATCH – SELECT VARIABLE “COUNT”

The Watch window should now show the address, value and name of the two registers. At this point in the program, they will both be zero.

Note: Items can also be added to the Watch window by dragging them from the SFR, File Register or Editor window or by clicking directly in the window under symbol name and typing in the item.

FIGURE 2-21: WATCH – RESET VALUES

A Basic Tutorial for MPLAB IDE

You could continue single stepping through the code, but instead, set a breakpoint just before the first value is sent out to PORTC. To set a breakpoint, put the cursor on the line following line:

```
movwf    PORTC    ; display COUNT on PORTC
```

and click the right mouse button.

FIGURE 2-22: DEBUG CONTEXT MENU (RIGHT MOUSE CLICK ON LINE)

Select "Set Breakpoint" from the Context menu. A red "B" will show on the line. (You can also double click on a line to add a breakpoint.)

FIGURE 2-23: EDITOR WINDOW – SET BREAKPOINT

Select *Debugger>Run* to run the application. A text message "Running..." will briefly appear on the status bar before the application halts at this first breakpoint.

The Watch window should now show that the variable `COUNT` was incremented by one but, since the breakpoint is at the line before the move to `PORTC` executes, `PORTC` still has a value of zero.

FIGURE 2-24: WATCH – AT BREAKPOINT

Press the **Run** icon to execute the code until it hits this point again. The Watch window should now show both values incremented by one.

FIGURE 2-25: WATCH – NEXT BREAKPOINT

This would seem to indicate that the program is working as designed. You can single step through the code or run the code more times to verify that it is executing properly. If you single step into the delay loop, you will get stuck executing thousands of steps until reaching the end. To exit out of the delay loop, use *Debugger>Step Out*.

If you are interested in calculating your delay time, the timing information in the device data sheet could be used to determine how long each instruction would take in your delay loop and you would come up with a pretty accurate number. You can also use the MPLAB Stopwatch to measure the delay. Your main interest should be the time each new value of `COUNT` is being displayed. If you set your breakpoint as was initially done, on the instruction that moves `COUNT` to `PORTC`, you can run to the next breakpoint at the same place to measure the time.

A Basic Tutorial for MPLAB IDE

Use *Debugger>Stopwatch* to bring up the Stopwatch dialog. Make sure that a single breakpoint is set at the `movwf COUNT` instruction, and then press *Debugger>Reset* and then *Debugger>Run* to halt at the `movwf COUNT` instruction. With the default processor frequency of 4 MHz, the Stopwatch should show that it took 8 microseconds to reach the first breakpoint.

FIGURE 2-26: STOPWATCH – AT FIRST BREAKPOINT

Execute Run again to go around the loop once, and note that the Stopwatch shows that it took about 49 milliseconds. To change this, you can change the values in the delay loop.

FIGURE 2-27: STOPWATCH – AFTER DELAY

2.13 TUTORIAL SUMMARY

By completing this tutorial, you have performed the major steps for creating, building and testing a simple project. Tasks completed include:

- Selecting the device – the PIC18F452.
- Using the Project Wizard to create a project, and using the Project Wizard to:
 - select the MPLAB IDE built in MPASM assembler and MPLINK linker language tools,
 - add files for the project: a template file for the device selected and a linker script to build it properly.
- Writing some simple code to send a changing value out an I/O port.
- Building the project.
- And finally, testing the code with the simulator.

These are the essential steps for getting started with MPLAB IDE. You are now ready to continue exploring the capabilities of MPLAB IDE.
